                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          domain-protein tyrosine phosphatase (HD-PTP; AAB29661) and to human HD-PTP protein tyrosine phosphatase (HD-PTP; AAB29661) and to human HD-PTP nucleic acids (AAC81224, AAC81225, AAC81262). The HD-PTP CG gene is located on chromosome 3p21.3. This region is frequently found to be deleted in lung cancers, and is therefore thought to contain a tumour suppressor gene. The invention also relates to expression vectors and host cells containing human HD-PTP nucleic acids; the recombinant production of HD-PTP; anticancer drugs containing HD-PTP; gene therapy compositions containing DNA encoding HD-PTP; diagnostic reagents containing HD-PTP pligonuclectides; antibodies specific for use in cancer diagnosis and investigation. HD-PTP specific antibodies for use in cancer diagnosis and investigation. HD-PTP proteins, nucleic acids and cancers, particularly those of the lung. The present sequence represents a human HD-PTP PCR primer used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel prostate cancer specific genes and polypeptides encoded by the genes, useful for detecting, diagnosing, monitoring, staging, prognosticating, imaging and treating prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 22 BP; 5 A; 9 C; 4 G; 3 T; 0 U; 1 Other;

                                                                                                                       CC designated BGTNC#10 (AAB60393) and to the CDNA clone encoding it

CC (AAF27486). The human BGTNC#10 gene is located on chromosome 22q11, in a

CC region associated with DiGeorge's syndrome (a congenital disorder which

CC is often associated with heart defects, anomalies of the major vessels,

CC oesophageal atresia and abnormalities of facial structures). The human

CC BGTNC#10 gene was identified in a human genomic sequence (GenBank

CC (AC005500) via homology with a murine BGTNC. Appropriate PCR primers

CC (AAF27479-AAF27485) were designed to isolate the human BGTNC#10 CDNA from

CC (AAF27479-AAF27485) were designed to isolate the human BGTNC#10 CDNA from

CC (AAF27479-AAF27485) were designed to isolate to expression vectors

CC (AAF27479-AAF27485) were designed to isolate the human BGTNC#10 CDNA; the recombinant

CC and transformants comprising the human BGTNC#10; a monoclonal antibody

CC recognising BGTNC#10; a hybridoma producing such an antibody; a method of

CC compounds thus identified. The human BGTNC#10; a monoclonal antibody

CC screening for a ligand which binds to a human nurse cell receptor; and

CC compounds thus identified. The human BGTNC#10 CDNA can be used in the

CC detection and diagnosis of DiGeorge's syndrome. The present sequence

CC represents a mouse nurse cell receptor BGTNC#10 RACE (rapid amplification

CC of CDNA ends) PCR primer used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

The method comprises contacting a biological sample comprising mRNP complex with ligand that specifically binds a component of mRNP complex, separating mRNP complex by binding the ligand with a molecule specific for ligand, which is attached to the solid support and then collecting the mRNP complex by removing the complex from the support. The method is useful for in vivo partitioning of cellular mRNA protein complexes in a biological sample. The method is useful for determining the ribonomic profile of a cell which has numerous uses including monitoring of tumour development, state of growth or state of development, perturbations of a biological system such as disease, drug or toxin treatment and the state of cell aging or death, attributed the state of cell aging or death.
                                                                                                                                                                           distinguishing ribonomic profiles among organisms, to discriminate between transcriptional and post-transcriptional contributions to gene expression and to track the movement of RNAs through RNP complexes, including the interactions of combinations of proteins with RNAs in RNP complexes. AAH28281-AAH28316 represent sequences derived from the 3' untranslated region (UTR) of mRNA of various genes. The sequences contains

                                                                                                                                                                                                                                                                                                                      CC mRNA protein (mRNP) complexes. The method comprises contacting a component of mRNP complex with ligand that specifically binds a component of mRNP complex with ligand that specifically complex by binding the condition of mRNP complex with ligand that specifically conditions a component of mRNP complex with ligand that specifically conditions are complexed to the condition of the support and then collecting the mRNP complex by removing the conditions of callular mRNA protein complexes in a biological sample. The method is useful for determining the ribonomic profile of a cell which has numerous conditions of a biological sample. The method is useful for determining the ribonomic profile of a cell which has numerous conditions of a biological system such as disease, and the conditions of a biological system such as disease, conditions of conditional conditi

The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant cumours (e.g. cancers of the brain, lung, overy, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies). Lyme disease, preventing or ameliorating the symptoms resulting from exposure to a biovariare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new polynucleotide comprising a CC nucleotide sequence which is a polymorphic variant of a reference CC sequence for lecithin-cholesterol acyltransferase (LCAT). The invention CC is useful for identifying an association between a trait (preferably a CC clinical response to drug targeting LCAT) and at least one genotype or CC haplotype of LCAT gene. The method of the invention has applicability in Cdeveloping diagnostic tests and therapeutic treatments for Norum disease, CC fish-eye disease and atherosclerotic cardiovascular disease. The CC fish-eye disease and atherosclerotic cardiovascular disease. The CC diversity, anthropological lineage, the significance of diversity and CC lineage at the phenotypic level, paternity testing, forensic applications CC and for identifying association between the LCAT genetic variation and a CC trait such as level of drug response or susceptibility to disease. In CC didition, the methods for identifying the LCAT haplotypes present in CC individuals are useful in the development of drugs targeting LCAT. For CC example, determining the frequency of individual LCAT haplotypes in a CC trait of the development of drugs targeting LCAT and CC example, determining the frequency of individual LCAT haplotypes in a CC trait development of drugs targeting that are most the development of drugs targeting that are most constructed one of a collection (ABK97573) of PCR primers that CC were used in the methods of the invention to detect notwoenthisms in the construction of the produce of the development of the invention to detect notwoenthisms in the construction of the produce of the development of the invention to detect notwoenthisms in the construction to the construction to detect notwoenthisms in the construction to the construction to the construction to detect notwoenthisms in t

17-AUG-1999;
31-AUG-1999;
                                                                                                                                                                                          The present invention relates to the isolation of novel human PRO polypeptides (AAU86128-AAU86162) and the polypucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorder inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. The present sequence represents a probe used in the methods of the present invention
                                                                                                                                                           Sequence 22 BP; 0 A; 11 C; 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Marsters SA,
Watanabe CK,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated functional Type II gonadotropin-releasing hormone receptor (Type II GnRH-R), or a peptide comprising at least a portion of exon I of Type II GnRH-R, nucleic acids encoding the receptor, an expression vector comprising the nucleic acid, a host cell transformed with the vector, a transgenic animal having the construct stably integrated into its genome, an antibody able to bind specifically to Type II GnRH-R. The Type II GnRH-R is useful in gene therapy. The Type II GnRH-R is particularly useful for inhibiting endogenous Type II GnRH binding to its native receptor in vivo or as a contraceptive. The receptor may also have roles in neural development and sexual arousal. The present sequence is a PCR primer used to isolate a nucleic acid encoding marmoset type II GnRH-R
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-APR-2000;

Colymphoma-specific immunoglobulin heavy and light chains. The invention of relates to a novel composition for altering a B-cell mediated pathology in a patient. The composition contains a chimeric protein comprising at Cleast a portion of a variable region of heavy chain or light chain (WH or CV L) linked to at least a portion of an immunoglobulin constant region, converted with a B cell clone from the patient chaving the B cell mediated pathology. The composition of the invention constant region, convergence of the pathology. The composition of the invention constant region, convergence of the pathology. The composition of the invention constant region, convergence of the pathology. The composition of the invention convergence of the pathology. The composition of the invention convergence of the pathology. The composition convergence of the pathology. This convergence is a vaccine useful for altering a B cell mediated pathology. This convergence is a vaccine useful for altering a B cell mediated pathology. This convergence is a vaccine useful for altering a B cell mediated pathology. This convergence is convergence of the pathology of the pathology is subscience, autoimmune thyroiditis and scleroderma. The pathology is convergence of the pathology is a cytokine e.g. granulocyte-macrophage-colony stimulating factor (GM-CSF) or chemokine e.g. monocyte chemotactic protein 3 (MCR 3)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound 8-50 nucleobases in length targeted CC to a nucleic acid molecule encoding casein kinase 2-alpha. The compound Specifically hybridises with and inhibits the expression of casein kinase CC 2-alpha, or specifically hybridises with at least an 8-nucleobase portion CC of an active site on a nucleic acid molecule encoding casein kinase 2-CC alpha i.e. an antisense ollgonucleotide. Also included are: (1) a CC composition comprising the compound and a carrier or diluent; (2) a CC contacting the expression of casein kinase 2-alpha in cells or tissues by CC contacting the cells or tissues with the novel compound; and (3) treating CC an animal having a disease or condition associated with casein kinase 2-alpha by administering to the animal the compound cited above so that CC expression of casein kinase 2-alpha is inhibited. The antisense compounds CC are useful for modulating the expression of casein kinase 2-alpha and for CC treating diseases or conditions associated with expression of casein CC particularly cancer, such as breast cancer, prostate cancer, or liver CC cancer. The antisense compounds are also useful for diagnostics, CC inflammation or tumour formation, as research respents and kits, and in CC distinguishing between functions of various members of a biological CC used in an experiment to measure the levels of casein kinase-2 alpha mRNA cx used in an experiment to measure the levels of casein kinase-2 alpha mRNA cx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell and the cronssituted as the positions on the chromosome and arrayed. The order of the corresponding to the chromosome and arrayed. The antargate of the propersion of the chromosome and arrayed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to a new fusion polypeptide or its pharmaceutically acceptable salt comprises at least one IgE-binding domain fused to at least one human serum albumin (HSA) component, where the IgE-binding domain is the sequence (a) defined residues Val26-Leu204 of the protein sequence appearing as ABG32801, or a truncation at the carboxy terminus by 1-12 amino acids. Also included are: (1) a fusion polypeptide defined by residues Val26-Leu278 of the protein appearing as ABG32803; (2) a polynucleotide sequence encoding the fusion protein; (3) a host cell transformed with the polynucleotide; (4) a method of preparing the fusion protein comprising transforming a host cell with a vector comprising transforming a host cell with a vector comprising transforming a host cell with a vector for polypeptide in the cell, and recovering the fusion polypeptide from the cappressing a polynucleotide sequence encoding the fusion polypeptide from the cappressing a polynucleotide sequence encoding a fusion polypeptide of cappressing a polynucleotide sequence encoding a fusion polypeptide of formula (1), (II), (III), (IV), or (V) or its salts (R_1-L-R_2 (I), R_2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for the inspection of alley diseases. The method involves measuring the expression level of a ger selected from the group consisting of method. F. E48 antigen, c-fos, involucin, BENE, HBp17, fibronectin and Idl in a biopsy sample, and comparing it with the expression level of the gene in a biopsy sample a healthy person. The present primer was used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, IgE receptor; reepsilountalpin, ic., antiallergic; dermatological; antiallemmatory; antiasthmatic; 88; IgE binding domain; systemic allergy; IgE-receptor-mediated disorder; atopic dermatitis; atopic asthma; chronic urticaria; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         976/c

The compositions and methods of the present invention are useful for the prevention and treatment of systemic allergy and other IgE-receptor-mediated disorders such as atopic dermatitie, atopic asthma and chronic urticaria. The IgE-binding polypeptide have a more prolonged effective serum life, more improved clinical utility in the treatment of allergy, as well as improved activity in a more efficient and costeffective manner. The present sequence is a sequencing primer for the IgE

```

The invention relates to a method for identifying a T cell receptor variable (TCRV) gene expressed by target T cells in an individual, comprising determining expression of TCRV genes by activated T cells from the individual and determining regulatory activity elicited in response to TCRV peptides from the individual. A preferentially expressed TCRV gene whose TCRV peptide elicits low T cell regulatory activity is identified as a variable gene expressed by target T cells. The method is used to identify disease-associated T cells in an individual so that individualised therapies can be designed to prevent or treat the disease particularly an autoimmune disease, especially multiple sclerosis. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in

T cells from

WPI; 2002-697882/75.

Identifying a T cell receptor variable gene expressed by target T cells in an individual is useful to identify disease-associated T cells for design of individualized therapies, particularly for autoimmune disease

                                                                                               The invention provides new human C2H2-type zinc finger proteins, MFQ-110. The MFQ-110 polypeptides can be expressed by standard recombinant methodology. The MFQ-110 polypeptides and polynucleotides can be used in diagnostic assays for detection of abnormally decreased or increased levels of polypeptide or mRNA expression. This may be used for diagnosing or determining susceptibility of a subject to disease that include developmental disorders, neurodegenerative disease, brain stroke, psychiatric disorders such as schizophrenia, cardiac and vascular disease, angiogenesis and cancer especially lymphomas. The polypeptides may be used to identify membrane bound or soluble receptors and may be used to identify membrane bound or soluble receptors and may be used to identify agonists and antagonists which compete with receptor binding. The polynucleotides may be used to identify membrane brained gene, for chromosome localization studies and tissue expression studies. Sequences AMI67914-17 represent

musculoskeletal disorders. polypeptides, termed NOVX, useful for treati disorders, hemophilia, Lesch-Nyhan syndrome, New isolated cytoplasmic, nuclear, membrane bound and secreted, useful for treating inflammation, asch-Nyhan syndrome, pancreatitis, autoimmune

Example 2; Page 207; 245pp; English.

or secreted polypeptide, designated NoVX (actually NOV1, 2a, 2b, 3a, 3b, 4, 5a, 5b, 5c, 5d, 5e, 5f, 5g, 5h, 5i, 6, 7 and 8), a variant of NOVX, a mature form, or a variant of the mature form of NOVX. Also included are a polynucleotide encoding NOVX (or its complement), a vector comprising the polynucleotide, a cell comprising the vector, an anti-NOVX antibody, determining the presence of NOVX in a sample using the antibody determining the presence of NOVX in a sample using the antibody which binds to NOVX polynucleotide in a sample using the presence of NOVX in a sample using the probe which binds to NOVX polynucleotide, identifying a an agent which binds to NOVX (including modulators of NOVX). NOVX, the polynucleotide and the The invention relates for diagnosing, to an isolated cytoplasmic, treating or preventing nuclear, membrane bound

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC associated disorder selected from cardiomyopathy, atherosclerosis, CC diabetes, a disorder related to cell signal processing and metabolic cc pathway modulation, inflammation, autoimmune disorders, scleroderma, CC transplantation, allergies, systemic lupus erythematosus, haemophilia, CC graft versus host disease, Alzheimer's disease, stroke, Lesch-Nyhan CC syndrome, periodontitis, pancreatitis, musculoskeletal disorders, pain, CC parkinson's disease, behavioural disorders, pain, CC neurodegenerative and neuropsychiatric disorders, hypertension, wound CC many other diseases and disorders listed in the specification. NoVx, the polynucleotide and the antibody are useful in screening assays, detection assays (e.g., chromosomal mapping, tissue typing, forensic biology), CC predictive medicine (e.g., diagnostic assays, prognostic assays, cereming clinical trials and pharmacogenomic), and in methods of treatment (e.g., therapeutic and prophylactio). NoVX is useful as communogen to produce antibodies immunospecific for NoVX, as vaccines to screen for potential agonist and antagonist compounds, and as bait constell in gene therapy, to express NOVX, to detect NOVX mank or a genetic lesion in a NOVX gene, and to modulate NOVX activity. The vector is constituing, and purifying NOVX and to monitor protein levels in tissue a part of a clinical testing procedure. The present sequence is an RT cream and transcriptase)-PCR primer used to quantitate mRNA encoding a

The invention describes a new isolated polypeptide (NOVX). The NOVX cc polypeptide, nucleic acid and antibody are useful as therapeutics, associated with a human disease, which includes a pathology associated cc with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease cor condition. In particular, the NOVX cc polypeptide or polynucleotide is useful for treating endocrine/ cc metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, ce pilepsy, multiple sclerosis, schizophrenia or depression), autoimune cc and inflammatory disorders (e.g. psoriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cencers (e.g. colon, lung, liver, breast, ovarian, cc prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (emphysema or obstructive pulmonary disease), these are also useful in developing powerful assay system for functional canalysis of various human disorders, as well as in disgnostic capplications, and for monitoring the effects of drugs during clinical trials. This sequence represents a primer used to isolate DNA encoding cover luman NOV proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19-SEP-2001; 2001US-0323519P.

                                                                                                                                                                                                                                                                                   antiarteriosclerotic, anorectic, antiasthmatic, nephrotropic, virucide, antiarthritic, hepatotropic, neuroprotective, antibacterial, relaxant, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparkinsonian, vulnerary, angiogenic and antiangiogenic activities, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of [1] in a sample. The NOVX polypeptides, polynucleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorder such as hypertension, cardiomyopathy, atherosclerosis, cancer, diabetes, asthma, inflammation, autoimmune disorders, allergies, blood disorders, obsesity, acquired immunodeficiency syndrome (AIDS), immunoglobulin (Ig)A nephropathy, infections (e.g. bacterial, viral, parasitic), stroke, muscular infections (e.g. bacterial, viral, parasitic), stroke, muscular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Spytek
Guo X,

Genotyping of FCGR2A-131H/R was performed in order to determine any correlation between genotype and response to therapeutic antibody treatment in non-Hodgkin's lymphoma (NHL) patients. The present (sense) primer was modified to create a BstUI site in case of R allele, and the antisense primer (see ACC58207) was modified to create a BstUI site in case of R allele, site that served as an internal control. PCR amplification of genomic DNA was performed. Amplified DNA was digested with BstUI and separated by electrophoresis, staining with ethidium bromide. The FCGR2A-131H and respectively. There was no correlation between FCGR2A-131R/H genotype and response to treatment. In contrast, FCGR3A-158V/F genotyping revealed a correlation with antibody treatment response in NHL patients

The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes (LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and

PT Making a library of anti-ligands having a cavity binding site for a pT ligand, useful in screening for a ligand.

XX Example 1; Page 16; 65pp; English.

XX Example 1; Page 16; 65pp; English.

XX This invention relates to a novel method of generating anti-ligand comprises providing combinates that have a cavity binding site. The method comprises providing comparises providing several novel anti-ligands having a cavity for binding a first ligand, and differing from the first anti-ligand in that one or more of the amino comparises and comparises are comparised by site and differing from the first anti-ligand in achieved by site are comparised by site of the cavity binding surface are replaced by those having similar but compared to the first anti-ligand is an action of the cavity binding surface are replaced by those having similar but compared to the properties. Preferably the anti-ligand is an compared to the replacements are derived from a natuarl CDR (complementarity determining region) that makes up the cavity and which binds to the ligand - an antigen. Specific anti-ligands compared to improve their binding characteristics or to better corrleate their final use. This oligonucloetide is PCR primer 9 used co amplify the continuous continuous fragment in order to generate the anti-ligand library of the livention.

                                                                                                                                                                                                                                                                            The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-JUL-2001;

The method comprises fractionating an aliquot of water by size to yield several fractions, isolating but from the fractions, amplifying but by high throughput, real time PCR comprising forward and reverse genus-specific primer to yield amplified DNA amplicon, contacting the amplicon with a species-specific labelled probe, and detecting the amplicon. The method is useful for identifying water-borne organisms associated with harmful algal bloom or transported in the ballast of a ship, where the water-borne organisms are dinoflagellates selected from Pficeteria, Gymnodinium, Chattonella, Alexandrium and Aureococcus, or is a zebra mussel (Dreissena). The present sequence is that of a species-specific PCR primer which may be

                                                                                                                                                                             á
                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying a T cell receptor (TCR) variable (V) copptide useful as a therapeutic agent in a subject with a disorder, CC comprising screening TCR V beta and/or TCR V alpha peptides to select a CC TCR V peptide that produces altered expression of a cytokine in response CC to the peptide by T cells from the subject, and determining a regulatory CC activity of CD4+CD25+ T cells isolated from the subject in response to CC the peptide. Also included are monitoring the efficacy of a TCR V peptide CC subject to the peptide and determining a T cell regulatory activity of CD4+CD25+ T isolated from the subject, where induction or regulatory activity indicates the efficacy of the peptide for treatment of the SC subject), selecting a therapy for a subject (comprising: identifying a CC RV gene expressed by target T cells in the subject by screening for CC expression of a TCR V gene by activated T cells from the subject and determining expression of a cytokine elicited in response to one or more CC subject, thereby identifying a TCR V gene expressed by target T cells for TCR V gene by T cells from the subject and clear if the subject, thereby identifying a TCR V gene expressed by target T cells or responding to the TCR V gene by target T cells)

CC subject, thereby identifying a TCR V gene expressed by target T cells)

CC nemtide is useful for identifying a T cell receptor (TCR) variable (V)

CC peptide useful as a therapeutic agent in a subject with a disorder. The

                                                                                                                                                                                                                                                                                      peptide is used to treat an autoimmune disease, particularly multiple sclerosis, rheumatoid arthritis, systemic lupus crythematosus, type I diabetes, non-obese diabetes, wasthenia gravis, Grave's disease, Hashimoto's thyroiditis or psoriasis. The present sequence is a TCR V alpha reverse transcriptase (RT)-PCR primer used to measure TCR gene expression levels, in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-MAY-2003; 2003US-00438729

These alleles are associated with Crohn's disease (CD). The presence of nucleic acid encoding 3 or more of the alleles in a subject is indicative of CD. The primers provide a reliable method of screening for CD and are useful for distinguishing between CD and ulcerative colitis patients. The presence of a nucleic acid carrying 3 or more of the alleles a2, b1, c2, d4 and e1 indicates a CD patient and in ulcerative colitis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAT63128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           kDa subunit gene promoter region (see also AAT63125) suggested that element(s) conferring inducibility lay within 900 bp immediately upstream of the transcription start point (TSP). A series of fine deletion constructs were made by fusing 200 bp deleted fragments of this 900 bp region to a beta-glucuronidase marker gene. PCR primer AI2 (AAT63128) was designed to correspond to a PstI site adjacent to the TSP. It was used in combination with primers AI3, AI4, AI5 and AI6 (AAT63129-32) in PCR experiments to generate fragments of 217, 378, 570 and 760 bp, respectively. Transient transformation assays indicated that the
                                                                                                                                                                                                                                                                                                                                              Manic-depressive illness; susceptibility; genotype; chromosomal marker; polymorphic marker; chromosome :
                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAV57842;
                                                 New isolated IMP.18p myo-inositol monophosphatase - used to products for determining susceptibility to manic depressive as targets for preventive and therapeutic treatments.
                                                                                                                                   Detera-Wadleigh

A method has

been developed for determining

Ø

genotype associated with

PCR primers AAV64633-34 are used in PCR analysis of tumour necrosis factor (TNF) microsatellite alleles to identify TNF locus c. The specification describes a method for detecting the presence or absence of at least two TNF microsatellite alleles selected from TNFa10, TNFb4, TNFc1, TNFd3 and TNFe3 in a patient with Crohn's disease, where the presence of an allelic combination comprising at least two of the alleles indicates a clinical subtype of Crohn's disease having an inferior clinical response to anti-Th1 cytokine therapy. The methods and the products can be used for diagnosing clinical subtypes of Crohn's disease, that affect the gastrointestinal tract and produce similar symptoms, with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           increased susceptibility to manic-depressive (MD) illness. The method comprises determining the genotype of an affected individual with at least one polymorphic marker localised within the chromosomal region defined by and including markers D18843 and D18869 and determining the genotype associated with increased susceptibility to MD disorder. The method can be used for determining susceptibility to MD illness including bipolar disorder, genetic counselling of individuals from families affected with MD illness, and aid in the differential diagnosis of MD illness from other psychiatric pathologies. Products from the present invention can also be used to obtain modulators of IMP.18p myo- inositol monophosphatase protein activity and as targets for preventive and therapeutic treatments. The present sequence represents a PCR primer from Table 1 in the present invention (see AAV57798 to AAV57877)
                                                                                                                                                                   Diagnosis of Crohn's disease sub:types - by detecting serological genetic markers for identifying sub:types having characteristic responsiveness to anti-Th1 cytokine therapy.

                                                                                                                                                                                                                                                                        This sequence represents a PCR primer used in the creation of the human erythropoietin (EPO) isoforms of the invention. The isoforms have a single isoelectric point and have a specific number of sialic acids per molecule, the number being selected from 1-14, and the isoform being the product of the expression of an exogenous DNA sequence in a non-human eukaryotic host cell. The isolated EPO isoforms have a defined sialic acid content and biological activity, e.g. the relative in vivo specific activities increase stepwise from isoforms having 5 sialic acid residues to isoforms having 11 sialic acid residues. The EPOs can be used for

Alternatively, this subtype is diagnosed by detecting at least two of the tumour necrosis factor (TNF) alleles (microsatellite loci) TNF a2, b1, c2, d4 and e1, more specifically the TNFa2blc2d4e1 haplotype (A). Ab and haplotype (A) are useful as independent markers of the resistant subtype of UC. The methods identify a subset of UC patients who do not respond to treatment with anti-inflammatories and/or immunosuppressants, and who generally will eventually require colectomy. Barly identification of the resistant subtype will allow aggressive treatments to be applied before inflammation has become refractory. The present sequence represents a specifically claimed PCR primer for amplifying TNF microsatellite loci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TNF microsatellite locus; tumour necrosis factor; human; PCR primer; amplification; diagnosis; ulcerative colitis; TNFa2b1c2d4el haplotype; anti-inflammatory; anti-Saccharomyces cerevisiae antibody; colectomy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than in IMC-LM cell lines using differential display of the mRNA in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: biringing into contact with the cancer metastasis associated protein (CMAP) and determining the degree of binding; or creating a transformant cell line which expresses CMAP and measuring the degree of expression of CMAP using an antibody recognising the protein, either in the presence or absence of the potential inhibitor. IMC-HM cells transformed with antisense CMAP DNA show a lowered ability to

The specification describes nucleotide sequences which have a regulatory activity on the transcription of the I-2 resistance gene in plant host cells. The transgenic plants, especially tomato, egg plant, potato, melon, tobacco and Arabidopsis, are capable of expressing a gene mediating resistance to a plant pathogen, such as fungi, in a tissue-specific manner. The plant is capable of preventing infection by a plant pathogen, such as fungi. Inserting the regulatory activity polynucleotide into plant cell genomes is useful for providing plants with reduced susceptibility to plant pathogens, especially for
                                                                                                                                                          Locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plant resistance mechanisms against plant pathogens such as fungi.
                                                         The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                                                                                         09-APR-1999;

                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) proteins comprising single nucleotide polymorphisms, useful for the design of drugs for treating obesity.
                                                                                                                                                                                                                                                       The present invention relates to the human uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) gene and polymorphisms. The polymorphisms are associated with obesity, especially diabetes mellitus associated obesity. They polymorphisms may be identified and analysed to determine whether an individual is susceptible to obesity and may be used as the basis for targeted design of drugs to treat obesity. The present sequence was used in the identification and amplification of UCP3
                                                                                                                                                                                                                                                                                                                                                                                                                              Chew A,

                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The invention relates to a method of diagnosing or predicting
CC susceptibility to an autoimmune disease in an individual. The method
CC comprises determining the presence or absence in the individual of a
CC disease-associated haplotype, i.e., the major histocompatibility complex
CC (MHC) class III 2-2-4 haplotype, or an allele associated with the MHC
CC class III 2-2-4 haplotype, where the presence of the 2-2-4 haplotype is
CC diagnostic of or predictive of a susceptibility to autoimmune disease.
CC The 2-2-4 haplotype refers to the Notch 4, HSP70-HOM and D6S273 loci
CC within the MHC class III region, where Notch 4 is present as allele 2,
CC HSP70-HOM is present as allele 2, and D6S273 is present as allele 2,
CC STP70-HOM is present as allele 2,
CC susceptibility to autoimmune diseases, including inflammatory bowel
CC susceptibility to autoimmune diseases, including inflammatory bowel
CC disease, rheumatoid arthritis, diabetes mellitus type I, and particularly
CC crohn's disease in an individual, especially an individual of of
CC predicting a variety of subtypes of Crohn's disease responsive to CA2
CC antibody therapy and other forms of anti-Th1 cytokine therapy; and
CC of the invention is non-invasive and is convenient mich these and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                         The invention relates to inhibiting cell adhesion mediated drug resistance (CAM-DR) in a patient involving administering to the patient, a peptide (comprising D-amino acids and having a sequence of KMVIYWKAG or its variant) that inhibits CAM-DR. The peptide is useful for enhancing efficacy of chemotherapy or radiation therapy in treating cancer (myeloma, preferably multiple myeloma) in a patient. The method improves the efficacy of chemotherapy and/or radiation therapy of cancer cells such as multiple myeloma without any disadvantages experienced during practice of conventional methods. The present sequence is an RT-PCR (reverse transcriptase PCR) primer used to amplify alpha4 integrin RNA semi-quantitatively in order to check transcription of this gene in a C cell line, KSc2/VLA-4, during an experiment where the cells (adhered to microtitre plates via interaction between the alpha4 integrin and the FN c receptor) are challenged with acute cytotoxic drugs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to the use of bisphosphonate compounds for inhibiting cell adhesion mediated drug resistance and enhancing efficacy of chemotherapy and/or radiation therapy in the treatment of cancer by inhibiting integrin-mediated cell adhesion. Cell adhesion is required by many normal processes but in some circumstances is undesirable, being involved in many pathologies. Cancer cell interaction with the extracellular matrix prevents apoptosis and can result in cell adhesion mediated drug resistance. This nucleotide sequence represents a primer used for human alpha4 integrin subunit specific reactions
                                                                New OmpA gene of Riemerers
for diagnosing septicemia

The OmpA protein can be expressed by standard recombinant methodology. An antibody (Ab) specific to the OmpA polypeptide is useful for diagnosing an infection by R.anatipestifer in an avian species. The OmpA gene and protein are useful for the preparation of vaccines and serodetective diagnostic assays. A vaccine composition comprising the OmpA gene, protein or Ab is useful for effective immunization of poultry against R. anatipestifer infection, especially septicemia anserum exsudativa. Sequences AAC85124-139 represent PCR primers used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interleukin-3; IL-3; ds; haematopoietic cell; haematopoietic disorder; acute myelogenous leukaemia; AML; bone marrow transplant; neutropaenia; thrombocytopaenia; aplastic anaemia; Chediak-Higashi syndrome; systemic lupus erythematosus; leukaemia; myelodysplastic syndrome; myelofibrosis; viral infection; microbial infection; parasitic infection; myelofibrosis; viral infection; microbial infection; parasitic infection;

The invention relates to ex vivo expansion of stem cells, comprises culturing stem cells with a growth medium comprising a human interleub 3 (II-3) mutant polypeptide or a polypeptide comprising an N-terminal methionine residue, alanine residue or methionine-alanine di-peptide preceding the II-3 sequence, and harvesting the cultured stem cells. I include are enhancing the efficiency of the transduction of cultured in the cultured of the transduction of cultured in the cultured of the transduction of cultured in the cultured of the transduction of the transduction of the transduction of cultured of the transduction of t

The viral construct and/or virus is useful in the manufacture of a medicament in the therapy of patients having neoplasm, where they are capable of causing death to tumour cell. They are useful in treating malignant and metastratic tumours derived from colon cells particularly liver tumours also for treating colorectal cancers and melanomas. The present sequence represents the double tumour specific transcription factor, TCF, binding site promoter replacement sequence used to insert TCF binding sites into the human adenovirus type 5 DNA sequence
                                      testing on a pooled sample, comprising employing an INVADER detection assay. The method is useful for detecting target nucleic acid sequences in pooled samples without prior amplification of the target. The method is particularly useful for detecting an allele frequency of a polymorphism, detecting a rare mutation, or testing large numbers of blood or plasma donations to eliminate units having pathogenic (e.g. viral) contamination. This polymucleotide sequence represents a probe

                                                                                                                                      The present sequence is a forward primer for a polynucleotide encoding a convel human G-protein coupled receptor (GPCR) that has been characterised as a respiratory chemokine receptor. RT-PCR was used to determine expression levels of the GPCR in different tissues. The receptor was compressed in respiratory tissues and tissues related to expressed in respiratory tissues and tissues related to monocyte/macrophage migration/activation, airway remodeling, airway compressed in regulation of mucocilliary clearance, regulation of mucus inflammation, modulation of neutrophil, T-cell and eosinophil migration and regulation of epithelial cell or mast cell cand/or activation, and regulation of epithelial cell or mast cell cardivation. GPCR polypeptides (see ABP58452-53) and polynucleotides (see AB257956-57) of the invention may be useful in treatment of asthma, characteristic control constructive pulmonary disease, emphysema, chronic bronchitis, in cuter respiratory distress syndrome, cough and acute bronchitis, in cuter respiratory distress syndrome, cough and acute bronchitis, in

                                                            least one assay selected from the group of acute myelogenous leukaemia cell proliferation, TF-1 cell proliferation, and methylcellulose assay, cand harvesting the cultured cells. The method is useful for selective exvivo expansion of stem cells. The recombinant human interleukin-3 variant or mutant proteins are useful for treating a patient having a haematopoietic disorder, such as cancer (e.g. acute myelogenous leukaemia) or certain types of B lymphoid cancers), leukopenia, neutropenia, aplastic anaemia, Chediak-Higashi's syndrome, systemic lupus erythematosus, myelodysplastic syndrome, or myelofibrosis. The cinterleukin-3 muteins are also useful as antagonists for producing antibodies used in immunoassay and immunotherapy protocols, or for stimulating bone marrow and blood cell activation and growth before infusion into patients. This sequence represents an ex vivo stem cell expansion method associated polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-NOV-1992;

therapy, e.g. using culturing the cells Ex vivo expansion of stem interleukin-3 f stem cells (e.g. hematopoietic cells) for gene expanded stem cells for treating thrombocytopenia, in a growth medium containing a variant or mutant of by

Disclosure; SEQ ID NO 1; 242pp; English

systemic lupus erythematosus, leukaemia, myelodysplastic syndrome, myelofibrosis, neutropenia or thrombocytopenia. The method is particularly useful for ex vivo expansion of haematopoietic cells in: (a) restoring haematopoietic cells to normal amounts in those where the number of cells has been reduced due to diseases or to culturing the stem cells with a growth medium containing a human interleukin-3 (MIL-3) mutant polypeptide. The HIL-3 mutant polypeptide has a 133, 111, 133 or 111 amino acid sequence (designated HIL-3a, HIL-3b, HIL-3c and HIL-3d, respectively), given in the specification. The method is useful for ex vivo expansion of stem cells for gene therapy. The expanded stem cells are useful for treating patients with a haematopoietic disorder e.g. aplastic anaemia, Chediak Higashi syndrome, describes ex vivo expansion of stem cells comprising cases for use

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearcyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (3) conjugates and/or kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cyrostatic and virulide activities. The siNAs can be used to modulate expression of SCD virulide activities. The siNAs can be used to modulate expression of SCD virulide activities.

They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Guanosine 5'-diphosphofucose; GDP-fucose; Guanosine 5'-diphospho-4-keto-6-deoxymannose; cardiovascular; infection; ss. /
                                                                                                                                                                                                                                            The present invention relates to producing guanosine 5'-diphosphofucose (GDP-fucose) by employing an enzyme source that is a culture broth of microorganisms. GDP-fucose is useful as synthetic substrate of complex carbohydrates that are useful e.g. for immunotherapy for protection against cardiovascular diseases, or infections by bacteria or viruses. Guanosine 5'-diphospho-4-keto-6-deoxymannose (GKDM) is useful as an intermediate for the production of GDP-fucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing guanosine 5'-diphosphofucose (GDP-fucose) useful as a substrate of complex carbohydrates for immunotherapy comprises employing microorganisms that convert guanosine 5'diphospho-4-keto-6-deoxymannose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                microorganisms to GDP-fucose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-193203/20

The polycytosine sequence, the AAAAAAG sequence and/or the number of TAA reparts has been modified in the DNA sequence. The modified gene is useful in the production of large amounts of Eucose-containing sugars, such as Lewis antigens for medicinal use. The present sequence is an oligonucleotide provided in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Helicobacter pylori; alpha-1,2-fucosyltransferase; fucose-containing sugar production; Lewis antigen:

        The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 31-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAR74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antirinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                 New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as

                                                                                                                                                                                                                                                                                 The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 31-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAR74905 where A in the wild type sequence at position 331 (corresponding to position-125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; CD40L; promoter; CD40 ligand promoter; rheumatoid arthritis; diagnosis; antiarthritic; antirheumatic; immunosuppressive; antiinflammatory; inflammatory disease; autoimmune disease; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD401) promoter (I) for CD40 ligand, having residues 31-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD401 poly-A tract sequence which is used in an example from the present invention

(I) has antiarthritic, and it in the manufacture of the compressive and antiinflammatory activities, and be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as disease which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence is used in an example from the present invention
